

Front end assignment

The assignment is to create a landing page for a fictional charity company called Little Zebra Foundation.

Briefing: Open the link to the Little Zebra Foundation folder in Google Docs.

1. Open up the README.md file to find a project outline, including some useful guidelines. You will also find designs and assets within other folders.
2. Create a static, responsive HTML5/CSS3 project to implement the design
3. The main part of the project is the donation widget which has the following functionalities:
 - the user can select 3 different animals to donate to: a giraffe, a rhino and a tiger;
 - based on the user selection the image on the right hand side changes accordingly (you'll find the images to use in the assets folder)
 - if the user inputs a custom donation amount any preselected choice will be automatically unselected
 - custom donation amounts cannot be lower than £11
4. Feel free to use any framework / library / tool you like and you feel is right for the task (e.g Bootstrap, jQuery or other templating / UI frameworks such as React)
5. Use the test to demonstrate how you would produce a clean, structured and quality-driven codebase in a real project assignment
6. Please provide the project source files via GitHub making sure to include a README.md document containing all the steps that we have to make to build the project (ideally you would use a build system like Webpack or Gulp for your project). You may also wish to talk about your workflow decisions
7. Share a public GitHub project link with us

The task should be completed ideally within 8 hours but feel free to complete it by **5pm on Monday 4th December**. If you have any doubts/questions regarding the assignment feel free to get in touch.

Good luck!
